What is a Weed?

- A plant out of place
- Native or non-native
- Non-native can be casual or naturalized

What About Invasive Plants?

- Naturalized non-native plants
- Growing or spreading rapidly
- Cause or have potential to cause harm
 - Economic
 - Environmental
 - Health

Invasive Dame's rocket

How can I tell if a plant *might*
be invasive?

“Great Groundcover” → spreads aggressively

Bishop's goutweed

“Food for Birds” → lots of seeds

Bull thistle

“Living Fence” → thicket-forming

“Stays Green Longer” → shifted phenology

Common buckthorn

“Sea of Blooms” → monoculture

Purple Loosestrife

“Winter Interest” → many fleshy fruits

Japanese barberry

**What are *some* impacts of
invasive plants?**

Thicket-forming shrubs reduce tree regeneration and can support higher tick populations

Honeysuckle

**Longer growth period allows plant to shade out
other species**

Common buckthorn

Monoculture → poor pollinator habitat

Purple Loosestrife

Many fleshy-fruited plants are easily spread by birds who eat the fruits. Most non-native fruits do not provide adequate nutrition to birds.

Japanese barberry

Which species are invasive?

Wisconsin's Invasive Species Rule- NR40

- Education about invasive species
- Goal to prevent introduction and spread
- Over 200 species listed as either "Prohibited" or "Restricted"

NR40 Classification

PROHIBITED

- Not yet established or only in pioneer stands
- No person may transport (import/ move), **possess**, transfer (buy/ sell) or introduce a prohibited species without a permit

RESTRICTED

- Already established in state
- No person may transport (import/ move), transfer (buy/ sell) or introduce a restricted species without a permit

PROHIBITED

RESTRICTED

Find the list of regulated species
at dnr.wi.gov, search "NR40"

What can I do in my yard?

1. Choose native plants

Native plants in your yard support many times more insects than non-native plants

Oaks = >500 species

Ginkgo = 0 species

Caterpillars = bird food

Doug Tallamy

Read more in Bringing Nature Home by Doug Tallamy

1. Choose native plants

- Buy from native plant nurseries
- Know where your plants come from
- Use tools to help select non-invasive plants
 - NWF Native Plant Finder

Native serviceberries support over 100 species of insects

2. Don't share aggressive plants

- Dispose of plants properly
- Consider replacing with non-invasives

3. Control invasive plants on your property

- Helps prevent spread to natural areas or neighbors
- UW Extension fact sheets provide information on non-chemical and chemical control

What can I do beyond my yard?

Community science opportunities + more!

The Invasion Curve

1. Report invasive plants

- With GLEDN app or email WIFDNcoordinator@gmail.com
 - Species name
 - Date you saw it
 - Location (GPS)
 - Photos to verify identification

2. Monitor Baseball fields for Emerald Ash Borer

- Wasp Watchers project
- Visit site June – September to count nests + collect beetles
- Great project for kids + families!

Upcoming webinar:
April 28th, 6-7 pm
Visit WIFDN website
for more information!

3. Look for Invasive Spotted Lanternfly or Tree-of-Heaven

- Spotted lanternfly not yet found in WI
- Mapping locations of tree-of-heaven will help us monitor for spotted lanternfly

Bugwood.org

5524251

Upcoming webinar:
April 14th, 6-7 pm
Visit WIFDN website
for more information!

5573236

4. Volunteer to remove invasive plants

- Local/county/state parks
- Recreational trails
- Lakes and rivers

5. Clean Recreational Equipment/Gear

**STOP AQUATIC
HITCHHIKERS!™**

Be A Good Steward.
Clean. Drain. Dry.

StopAquaticHitchhikers.org

**STOP INVASIVE SPECIES
IN YOUR TRACKS.**

PlayCleanGo.org

Clean Your Gear Before
Entering And Before Leaving
The Recreation Site.

6. Learn more and teach others

- Visit fyi.extension.wisc.edu/wifdn for videos and factsheets

Japanese barberry (*Berberis thunbergii*)

Brandon Panka and Mark Renz

Invasive plants can thrive and aggressively spread beyond their natural range, disrupting ecosystems. The *Management of Invasive Plants in Wisconsin* series explains how to identify invasive plants and provides common management options. Management methods recommend specific timings for treatment, as well as expected effectiveness.

Japanese barberry is a round, dense, spiny shrub, typically 2–3' tall, though it may grow up to 6' tall and 6' wide. The branches are reddish brown and deeply grooved with a single, sharp spine at each node. The wood beneath the bark is yellow. It spreads vegetatively through branches that root freely when they touch the ground.

Legal classification in Wisconsin:

All wild plants are restricted. Select varieties/hybrids are also restricted. Consult Wisconsin's Invasive species rule (NR 40) for details.

Leaves: Alternate, 0.5–1.5" long, entire, and shaped like a spatula with a narrow base and wide end (spatulate). Color varies depending on the cultivar, but includes green, bluish-green, or dark reddish-purple. Leaves are arranged in clusters above a spine.

Flowers: Mid-spring. Yellow, umbrella-shaped, 0.25" across with 6 petals. Flowers are found along the stem individually or in clusters of 2–4.

Fruits and seeds: Bright-red, oblong berries, 0.3" long. Fruit are found on narrow stalks along the stem individually or in clusters of 2–4. Fruit mature in mid-summer and can persist on shrub into winter.

Roots: Shallow root system. When scratched, the inner layer of the root is yellow.

Similar species: European barberry (*Berberis vulgaris*) is another introduced species that is sometimes invasive. European barberry spines occur in sets of 3, while Japanese barberry spines occur singly.

Ecological threat:

- Invades open and closed canopy forests, woodlands, oak savannas, wetlands, pasture, and meadows. Grows more vigorously on well-drained soils.
- Seeds are readily dispersed by birds.
- Sites infested with Japanese barberry have significantly more deer ticks (*Ixodes scapularis*) than sites where Japanese barberry control efforts have taken place or where barberry is not present.

Non-chemical control

Removal

Effectiveness in season: 90–100%
Season after treatment: 70–90%

Pulling or digging up small- to medium-sized barberry any time of the year is an effective individual plant control strategy if soil conditions are amenable. Remove the root crown, as Japanese barberry resprouts from that area. Small bushes can be pulled by hand and larger bushes can be pulled using a leverage tool. Digging up soil surrounding larger bushes can facilitate plant removal. If fruiting, avoid movement unless material can be transported without spreading fruit to other locations.

When to Look → Invasive Species Calendar

Wisconsin Invasive Species Calendar

The Calendar provides an overview of when to look for invasive species based on the best available life stage & detectability information collected by WIFDN & partners. Exact timing of life stages & detectability will vary with weather conditions in a given year & across the state. We welcome your feedback to improve the accuracy of the calendar! Contact us at WIFDNcoordinator@gmail.com.

Use the dropdown lists to
create a custom calendar

Habitat (All)	Form (All)	Detectability (Multiple valu...)	Life Stage (All)	Month (All)	Scientific Name (All)	Common Name (All)
